

HimShakti Bio-Waste & Processing Analytics

Week 4 Program Submission

Operational Performance & Supply Chain Yield Dashboard Report

AGGREGATE FINANCIAL LOSS

17,203,520 INR

MAX LEAKAGE CATEGORY

Herbal Extract (56.4%)

SECTION 1: DASHBOARD OVERVIEW

This operational dashboard tracks raw material processing weights, organic processing waste mass, and financial loss leakages across HimShakti's logistics network. It provides executive decision-makers with a macro view of supply chain processing efficiencies and crop resource utilization.

SECTION 2: KEY INSIGHTS

First, the ecosystem has accumulated an aggregate financial loss of 17,203,520 INR. Second, the breakdown donut chart proves Herbal Extract is the most severe cost center, driving 56.4% of total monetary leakages due to high baseline processing costs. Third, volume comparisons show Center-A handles the highest inbound burden exceeding 700,000 KG, making its localized waste trends highly influential to macro company margins compared to Center-B.

SECTION 3: BUSINESS RECOMMENDATION

Management should immediately deploy specialized quality control audits at Center-A to optimize its heavy volume pipelines. Furthermore, engineering teams must re-evaluate the raw extraction methods for high-value Herbal Extracts to suppress the disproportionate 56.4% cost drain, shifting resources toward higher-yield nutraceutical processing lines this quarter.

SECTION 4: CAVEATS / DATA LIMITATIONS

The current dashboard cannot isolate external environmental factors, weather variations during transport, or specific machinery calibration errors that might directly cause crop bruising and mass disposal events.
