

The Question

Operational Efficiency & Value Leakage in Processing

An Executive Analysis of HimShakti's Q2 Supply Chain

How can HimShakti optimize regional bio-waste processing yields and eliminate supply chain value leakages across its core crop processing facilities to protect overall corporate gross margins?

The Data

Data Architecture & Scope

Q2 Operational Window | 3 Primary Crops | 8 Performance Columns

The analysis evaluates regional processing logs tracking inbound weighbridge weights, factory waste mass, yield percentages, cycle times, and localized monetary losses across Ginger, Turmeric, and Herbal Extract processing lines

Insight 4: Loss Concentration

Herbal Extract Drives the Majority of Value Loss

TOTAL Q2 FINANCIAL
LEAKAGE REACHED
17,203,520 INR.
ANALYTICAL
SEGMENTATION REVEALS
THAT HERBAL EXTRACT
ALONE ACCOUNTS FOR
56.4% OF TOTAL
MONETARY LOSSES DUE
TO SEVERE YIELD DROPS
DURING SHOP-FLOOR
EXTRACTION.

Go Insight 2: Center Volume Correlational

Volume Inbalance Explains Waste Mass Variance

CENTER-A GENERATES HIGHER ABSOLUTE WASTE MASS PRIMARILY BECAUSE IT PROCESSES A SIGNIFICANTLY LARGER BASELINE VOLUME OF INBOUND RAW BIOMASS. EFFICIENCY RATES PER UNIT MASS REMAIN COMPARABLE ACROSS REGIONAL FACILITIES.

Insight 3: Throughput & Cycle Times

Processing Speed is Not the Root Cause

FULFILLMENT CYCLE TIMES REMAIN STEADY ACROSS ALL PLANTS, PROVING THAT FINANCIAL LEAKAGES STEM FROM PHYSICAL MACHINERY EXTRACTION FAILURES ON THE FACTORY FLOOR RATHER THAN OPERATIONAL BOTTLENECKS OR TRANSPORT DELAYS.

Recommendation

Strategic Action Roadmap

Action Steps:

- Mechanical Audits: Perform immediate engineering recalibrations on extraction machinery at Center-A to stop physical yield leaks.
 - Automated Alert System: Deploy Looker Studio threshold alerts to notify plant directors when waste mass crosses 15%.
 - Process Standardization: Standardize extraction workflows across all facilities using Center-B's higher-yield methods as the benchmark.
- 
-
